

Kaeluma

ADOBE ASSET PRODUCTION WORKFLOWS

Photoshop, Illustrator, Premiere Pro & After Effects Templates

CREATIVE PRODUCTION SPEC

This guide is designed for **Jayson** (kids' media producer and creator) utilizing **Adobe Creative Suite** (Photoshop, Illustrator, Premiere Pro, After Effects) to customize, polish, and export Kaeluma's brand assets.

1. Graphic Design Standards & Setup

Color Spaces

- **Target Web/Screen: sRGB IEC61966-2.1** (Never use CMYK or Adobe RGB for exporting web assets, as it will distort Kaeluma's glowing neon purples, seedling greens, and cyans on mobile screens).
- **Photoshop/Illustrator Settings:** Go to *Edit > Color Settings* and verify your Working Spaces RGB is set to **sRGB**.

Resolution

- All pre-generated marketing templates in `branding/` are output as 300 DPI master files to allow vector scaling and crisp text rasterization.
- **Export Settings:** When saving from Photoshop, use *File > Export > Export As...*, select **PNG**, and ensure **Embed Color Profile (sRGB)** is checked.

2. Photoshop (PSD) Layer Templates

When building launch campaigns, open the base template PNGs in Photoshop, set your canvas size, and organize your layer structure as follows:

```
[Layer Folder] Overlay Graphics & Banners
├─ [Layer] CTA Text & Headline (Outfit ExtraBold, White)
├─ [Layer] Supporting Copy (Inter Regular, Muted Silver #94a3b8)
├─ [Layer] Vector Logo SVG (Imported Link from logo_main.svg)
├─ [Layer Group] Glowing Delighters
│   └─ [Layer] Gold Coin Graphic (coin.png - isolated layer)
│       └─ [Layer] Glowing aura overlay (Blend Mode: Screen, Opacity: 40%)
└─ [Base Layer] Template Canvas (e.g. app_store_feature.png or banner.png)
```

Banner & Layout Specifications

1. **Open Graph Card (`og_share_card.png` - 1200×630)**
 - **Adobe Margin Setup:** Create guides 100px from all outer edges. Ensure the central sun logo is kept inside the safe zone so messaging isn't clipped in chat bubbles.
2. **App Store Feature Graphic (`app_store_feature.png` - 1280×720)**
 - Place device screenshots or child dashboard renders in the right 60% of the canvas.
 - Keep app title and CTA (Sticker chart alternative!) in the left 40%.
3. **Social Feed Post (`social_square_post.png` - 1080×1080)**
 - Center-aligned hierarchy. Perfect for high-contrast quotes or parent testimony text overlays.
4. **Email Hero (`email_hero.png` - 600×300)**
 - Set text sizes to 36pt or higher for high readability on small mobile screens.

3. Illustrator (AI) Logo Editing

Use the vector SVG logo versions (`logo_main.svg` , `logo_icon.svg` , `logo_main_vertical.svg`) in Illustrator for high-resolution print or resizing.

Importing & Editing SVG Logo Assets

1. **Open in Illustrator:** Open `logo_main.svg` directly in Illustrator.
2. **Verify Gradients:** The gradient on the "Kaeluma" wordmark is pre-coded to transition from Purple (`#a855f7`) to Cyan (`#38bdf8`). Adjust the Gradient tool handles to change the light incidence angle.
3. **Text Conversion:** If sharing the vector file with external developers or printers, select the "Kaeluma" text layer and run **Type > Create Outlines** (`Ctrl+Shift+O`). This converts the text into vector shapes, preserving the exact "Outfit" letter outlines even on computers without the font.

4. Video Production (Premiere Pro & After Effects)

Use the dynamic assets in Premiere Pro or After Effects to create high-engaging Shorts, Reels, and TikToks.

Video Template Overlay (`video_bg.png` - 1080×1920, 9:16)

This vertical frame features a transparent middle area, a glowing space border, and the footer logo.

1. **Import Asset:** Drag `video_bg.png` into your Premiere Pro bin.
2. **Timeline Setup:** Place your gameplay B-roll or talking-head video on Track V1. Place `video_bg.png` on Track V2 directly above it.
3. **Safe Zone Guidelines:** Position captions and text in the center third of the screen to prevent overlap with the borders or the Kaeluma branding.

Coin Animation Layer (`coin.png` - 512×512, 1:1)

An isolated 3D gold coin graphic.

1. **After Effects Setup:** Import `coin.png` into After Effects.
2. **Keyframe Idle Float:**
 - Apply a simple Expression to the *Position* property to make the coin float:

```
amplitude = 12; // vertical float height
frequency = 1.5; // speed of float
value + [0, Math.sin(time * frequency * Math.PI * 2) * amplitude];
```

- Apply a *Rotation* keyframe looping from 0 to 360 degrees to simulate spinning rewards.
